

Monday 10:12 AM

What is the best division for workout, I can go to gym from Monday to Friday

For training **Monday to Friday**, the best balanced division for muscle gain and strength is usually:

Monday — Upper Body

Chest, back, shoulders, biceps and triceps.

Tuesday — Lower Body

Quadriceps, hamstrings, glutes, calves and abdominals.

Wednesday — Push

Chest, shoulders and triceps.

Thursday — Pull

Back, rear delts and biceps.

Friday — Legs

Quadriceps, hamstrings, glutes, calves and lower back.

This **Upper / Lower / Push / Pull / Legs** split works well because most muscles receive stimulation about twice per week while still having enough recovery time.

A simple weekly volume target would be:

- Chest and back: **12–16 sets**
- Quadriceps and hamstrings: **10–16 sets**
- Shoulders: **10–14 sets**
- Biceps and triceps: **8–12 direct sets**
- Calves and abdominals: **6–12 sets**

Saturday and Sunday would be rest or light activity such as walking and mobility work. Since you previously preferred no more than six exercises per workout, this division also fits that limit very well.

Disregard my history For a obese 107kg male 1,81 height beginner workout routine for that division

Worked for 10s >

For a 107 kg, 1.81 m beginner, I would keep the **Upper / Lower / Push / Pull / Legs** structure, but use moderate weights, mostly stable machine exercises, and low initial volume. The objective during the first 6–8 weeks is to learn technique, improve conditioning and avoid excessive joint stress—not to train to exhaustion.

Weekly routine

Monday — Upper body

Exercise	Sets × reps
Machine chest press	2 × 8–12
Lat pulldown	2 × 8–12
Seated cable row	2 × 8–12
Machine shoulder press	2 × 8–12
Cable triceps pushdown	2 × 10–15
Machine or dumbbell curl	2 × 10–15

Tuesday — Lower body

Exercise	Sets × reps
Leg press	2 × 10–15
Seated leg curl	2 × 10–15
Leg extension	2 × 10–15
Machine hip thrust or glute bridge	2 × 10–15

Exercise	Sets × reps
Seated calf raise	2 × 12–20
Pallof press	2 × 10–12 per side

Keep the leg-press depth comfortable. Do not force the knees toward the chest if your lower back begins to round.

Wednesday — Push

Exercise	Sets × reps
Incline machine chest press	2 × 8–12
Pec-deck fly	2 × 10–15
Machine shoulder press	2 × 8–12
Cable lateral raise	2 × 12–15
Cable triceps pushdown	2 × 10–15
Overhead cable triceps extension	1–2 × 10–15

Thursday — Pull

Exercise	Sets × reps
Neutral-grip lat pulldown	2 × 8–12
Chest-supported machine row	2 × 8–12
One-arm cable row	2 × 10–12 per side
Reverse pec deck	2 × 12–15
Cable or machine curl	2 × 10–15
Hammer curl	1–2 × 10–15

Chest-supported rows are preferable initially because they reduce the demand on the lower back.

Friday — Legs

Exercise	Sets × reps
Leg press	2 × 10–15
Seated or lying leg curl	2 × 10–15
Supported split squat or low step-up	2 × 8–10 per leg
Machine hip thrust	2 × 10–15
Seated calf raise	2 × 12–20
Machine crunch or dead bug	2 × 10–15

For split squats, hold a fixed support. Replace them with leg extensions when knee discomfort, poor balance or excessive fatigue makes the movement difficult.

How hard to train

Choose a weight that lets you complete every repetition with controlled technique while finishing each set with approximately **3 repetitions still possible**. In practice:

- Do not train to failure during the first two months.
- Rest **90–120 seconds** after compound exercises.
- Rest **60–90 seconds** after curls, triceps, calves and abdominal work.
- Lower the weight under control; do not bounce or use momentum.
- A session should take approximately **45–60 minutes**.

During the first two weeks, doing only **one working set per exercise** is also acceptable if soreness or fatigue is high.

Progression

Use a simple repetition progression:

1. Begin with a weight you can perform for the bottom of the range.
2. Add repetitions gradually while maintaining technique.
3. Once you complete the maximum repetitions on both sets, increase the weight by the smallest available amount.
4. Return to the lower end of the repetition range.

Example: chest press at 30 kg for 10, 9 repetitions. Progress toward 12, 12 ; then increase the weight and begin again around 8–10 repetitions.

Cardio

After weights, perform **10–20 minutes** of low-impact cardio on three or four days:

- Recumbent bicycle
- Regular stationary bicycle
- Elliptical, when comfortable
- Treadmill walking without a steep incline

Start at a pace where you can still speak in sentences. Gradually work toward a total of **150 minutes of moderate activity per week**, which aligns with current public-health guidance; adults are also advised to strengthen all major muscle groups at least twice weekly.

 CDC +2

Because five consecutive gym days can create substantial soreness for a beginner, keep the initial volume low. Stop and seek medical evaluation for chest pain, faintness, unusual shortness of breath, or pain that feels sharp rather than like ordinary muscle fatigue.

Can it be this one?

The **pec deck** is a chest-fly machine used mainly for the **pectoralis major**, with some involvement from the front shoulders.

You sit with your back against the pad, place your forearms or hands on the machine arms, and bring your arms together in front of your chest.

Use it in your routine for **3 sets of 10–15 reps**.

Key form points:

- Keep your back and head against the pad.
- Keep a slight bend in your elbows.
- Bring the handles together under control.
- Do not let the elbows travel too far behind your torso.
- Avoid lifting your shoulders toward your ears.
- Stop with about **2–3 repetitions in reserve**.

It is also commonly called the **machine chest fly**.

This one?

Yes, that is a **pec deck / machine chest fly**.

For your plan, use it for **3 sets of 10–15 reps**.

Set it up so the handles start roughly in line with your chest, then:

- Keep your back against the pad.
- Keep a small bend in your elbows.
- Bring the handles together in front of your chest.
- Do not let your arms go excessively far behind your body.
- Return slowly and under control.

You should mainly feel the chest working, not pain in the front of the shoulders.

Machine shoulder press should I do the neutral or prone

For a beginner, I would start with the **neutral grip**—palms facing each other—when the machine allows it.

It usually feels more comfortable on the shoulders and makes it easier to keep the elbows in a safer position. Use the **pronated grip**—palms facing forward—only if it feels equally comfortable and you can press without shoulder pain.

Use these cues:

- Keep your elbows slightly in front of your body, not flared straight out.
- Keep your back and head against the pad.
- Do not lower the handles excessively deep.
- Stop before your shoulders roll forward.
- Use **3 sets of 8–12 reps**, keeping 2–3 reps in reserve.

Choose the grip that feels strongest and causes no pinching. For your routine, **neutral grip** is the default choice.
